

# ES. NEXT LECTURE 1

**By Mona Soliman**

# AGENDA

- Introduction about ES.Next
- Const & let
- New String Methods(startswith , endswith , includes)
- Template Literals (Template Strings)
- Arrow function
- Destructuring
- Rest parameter , Spread Operator
- Default Parameters
- New Array Methods (filter , find , findIndex , map)
- For of loop

# CONST & LET

- **`let`** is a signal that the variable may be reassigned, such as a counter in a loop, or a value swap in an algorithm. It also signals that the variable will be used only in the block it's defined in, which is not always the entire containing function.

- **`const`** is a signal that the identifier won't be reassigned

## VAR vs LET vs CONST

	var	let	const
Stored in Global Scope	✓	✗	✗
Function Scope	✓	✓	✓
Block Scope	✗	✓	✓
Can Be Reassigned?	✓	✓	✗
Can Be Redeclared?	✓	✗	✗
Can Be Hoisted?	✓	✗	✗

# NEW STRING METHODS

- startsWith()** returns a Boolean value—true or false—depending on whether the string starts with the substring you have specified.
- endsWith()** is the opposite of the **startsWith()** method. The **endsWith()** method determines if a string ends with a particular set of characters.
- includes()** method returns true if an array contains a specified value. The **includes()** method returns false if the value is not found. The **includes()** method is case sensitive.

# TEMPLATE LITERALS

# ES6

`Tagged `${Template}` Literals`

# ARROW FUNCTION

An arrow function expression is a compact alternative to a traditional function expression, but is limited and can't be used in all situations.

```
// ES5
var add = function (num1, num2) {
    return num1 + num2;
}

// ES6
var add = (num1, num2) => num1 + num2
```

# DESTRUCTURING

# REST PARAMETERS & SPREAD OPERATOR

**The spread operator** allows us to spread the value of an array (or any iterable) across zero or more arguments in a function or elements in an array (or any iterable).

**The rest parameter** allows us to pass an indefinite number of parameters to a function and access them in an array.

# DEFAULT PARAMETERS

```
function say(message='Hi') {  
  console.log(message);  
}
```

```
say(); // 'Hi'
```

```
say('Hello') // 'Hello'
```

# NEW ARRAY METHODS

**filter**

**vs**

**map**

# FOR OF

```
<script>
  let numeros = [11, 33, 55, 77, 99];

  for (let i of numeros) {
    console.log(i);      // log -> 11, 33, 55, 77, 99
  }
</script>
```

THANK YOU
