## Promises

a. Make your own interface to create tabs and display usernames by requesting users from the link below using Ajax ES6 fetch function:
https://jsonplaceholder.typicode.com/users

Note: handle the response with promises using then and catch methods.

b. When a user tab is clicked display its posts' titles by requesting the posts from the link below using Ajax ES6 fetch function:
https://jsonplaceholder.typicode.com/posts?userId=userId  Note:

- handle the response with promises using Async and await.
- do not get the posts of all users on page load, the user tab must be clicked to request its posts.

2) Using ES6 new Syntax & features:
Write a script to create different shapes (rectangle, square, circle) make all of them inherits from shape class.
a. each shape contains two functions to calculate its area and its parameter.
b. Display the area and each object parameter in your console by overriding toString().
c. Make your classes in an external file and import them in a module to create objects.
